

**FR. CONCEICAO RODRIGUES COLLEGE OF ENGINEERING**  
**Department of Computer Engineering**

**Course, Subject & Experiment Details**

<b>Academic Year</b>	<b>2023-24</b>	<b>Estimated Time</b>	<b>02 - Hours</b>
<b>Course &amp; Semester</b>	<b>T.E. (CMPN)- Sem VI</b>	<b>Subject Name &amp; Code</b>	<b>CSS - (CSC602)</b>
<b>Module No.</b>	<b>03 – Mapped to CO- 3</b>	<b>Chapter Title</b>	<b>Cryptographic Hash Functions</b>

<b>Practical No:</b>	<b>5</b>
<b>Title:</b>	<b>Performance Analysis of Hash Algorithms</b>
<b>Date of Performance:</b>	<b>13/02/2024</b>
<b>Date of Submission:</b>	<b>28/02/2024</b>
<b>Roll No:</b>	<b>9523</b>
<b>Name of the Student:</b>	<b>Arun Sanyal</b>

**Evaluation:**

<b>Sr. No</b>	<b>Rubric</b>	<b>Grade</b>
<b>1</b>	<b>On time submission Or completion (2)</b>	
<b>2</b>	<b>Preparedness(2)</b>	
<b>3</b>	<b>Skill (4)</b>	
<b>4</b>	<b>Output (2)</b>	

## Signature of the Teacher:

### Date:

Lab Manual prepared by : Prof. Monali Shetty

**Title:** For varying message sizes, test integrity of message using MD-5, SHA-1, and analyse the performance of the two protocols.

### Lab Objective:

This lab provides insight into:

- The working of MD5 and SHA-1 and variations of SHA-1 and analyze the performance of both for varying message sizes.

**Reference:** “Cryptography and Network Security” B. A. Forouzan

“Cryptography and Network Security” Atul Kahate

[www.md5summer.org/download.html](http://www.md5summer.org/download.html)

**Prerequisite:** Java or Python and Knowledge of hashing and Crypt API.

### Theory:

Cryptographic hash functions are a very useful tool in cryptography. They are applied in many areas like integrity of messages, storage of passwords securely and protect signatures. The three hash algorithms SHA-1, SHA-512 and MD5 are considered to analyze their performance.

### MD5

- Takes as input a message of arbitrary length and produces as output a 128 bit “fingerprint” or “message digest” of the input.
- It is conjectured that it is computationally infeasible to produce two messages having the same message digest.
- Intended where a large file must be “compressed” in a secure manner before being encrypted with a private key under a public-key cryptosystem such as PGP

### Input:

Suppose a b-bit message as input, and that we need to find its message digest.

### Algorithm:

**Step 1 – append padding bits:**

- The message is padded so that its length is congruent to 448, modulo 512. - Means extended to just 64 bits of being of 512 bits long.
- A single “1” bit is appended to the message, and then “0” bits are appended so that the length in bits equals 448 modulo 512.

**• Step 2 – append length**

- A 64 bit binary representation of b is appended to the result of the previous step. – The resulting message has a length that is an exact multiple of 512 bits.

**• Step 3 – Divide the input into 512-bit blocks**

Now we divide the input message into blocks , each of length 512 bits.

**• Step 4 – Initialize MD Buffer**

- A four-word buffer (A,B,C,D) is used to compute the message digest.
- Here each of A,B,C,D, is a 32 bit register.
- These registers are initialized to the following values in hexadecimal:
  - word A: 01 23 45 67
  - word B: 89 ab cd ef
  - word C: fe dc ba 98
  - word D: 76 54 32 10

**Four auxiliary functions**

In addition MD5 uses four auxiliary functions that each take as input three 32-bit words and produce as output one 32-bit word. They apply the logical operators and, or, not and xor to the input bits.

Round 1 = (b and c) or ((not(b) and d))  
Round 2 = (b and d) or (c and not(d))  
Round 3 = B xor c xor d  
Round 4 = C xor (b or not(d))

**The Constant t[i] or k[i]**

MD5 further uses a table K that has 64 elements. Element number i is indicated as  $K_i$ . The table is computed beforehand to speed up the computations. The elements are computed using the mathematical sin function:

$$K_i = \text{abs}(\sin(i + 1)) * 2^{32}$$

**• Step 5 – Process message in 16-word blocks.**

1. – Process message in 16-word (512-bit) blocks:
  - Using 4 rounds of 16 bit operations on message block & buffer
  - Add output to buffer input to form new buffer value
2. Output hash value is the final buffer value
3. The contents of the four buffers (A, B, C and D) are now mixed with the words of the input, using the four auxiliary functions (F). There are four *rounds*, each involves 16

basic *operations*. One operation is illustrated in the figure below.

Lab Manual prepared by : Prof. Monali Shetty

The figure shows how the auxiliary function  $F$  is applied to the four buffers ( $A$ ,  $B$ ,  $C$  and  $D$ ), using message word  $M_i$  and constant  $K_i$ . The item " $\lll s$ " denotes a binary left shift by  $s$  bits.

Round 1.

$[abcd\ k\ s\ i]$  denote the operation  $a = b + ((a + F(b, c, d) + X[k] + T[i]) \lll s)$ .

Do the following 16 operations.

$[ABCD\ 0\ 7\ 1]$   $[DABC\ 1\ 12\ 2]$   $[CDAB\ 2\ 17\ 3]$   $[BCDA\ 3\ 22\ 4]$   $[ABCD\ 4\ 7\ 5]$   $[DABC\ 5\ 12\ 6]$   $[CDAB\ 6\ 17\ 7]$   $[BCDA\ 7\ 22\ 8]$   $[ABCD\ 8\ 7\ 9]$   $[DABC\ 9\ 12\ 10]$   $[CDAB\ 10\ 17\ 11]$   $[BCDA\ 11\ 22\ 12]$   $[ABCD\ 12\ 7\ 13]$   $[DABC\ 13\ 12\ 14]$   $[CDAB\ 14\ 17\ 15]$   $[BCDA\ 15\ 22\ 16]$

**Output:**

- The message digest produced as output is  $A$ ,  $B$ ,  $C$ ,  $D$ .
- That is, output begins with the low-order byte of  $A$ , and end with the high-order byte of  $D$ .

### SHA-1

Processing is similar to SHA-1 with small variations. In SHA-1, chaining variables are 5 and Boolean operations are different.

Lab Manual prepared by : Prof. Monali Shetty

## Analysis

### *Differences between MD5 and SHA Algorithms*

Keys For Comparison	MD5	SHA
Security	Less Secure than SHA	High Secure than MD5
Message Digest Length	128 Bits	160 Bits
Attacks required to find out original Message	$2^{128}$ bit operations required to break	$2^{160}$ bit operations required to break
Attacks to try and find two messages producing the	$2^{64}$ bit operations required to break	$2^{80}$ bit operations required to break

same MD		
Speed	Faster, only 64 iterations	Slower than MD5, Required 80 Iterations
Successful attacks so far	Attacks reported to some extents	No such attach report yet

Lab Manual prepared by : Prof. Monali Shetty

#### **MD5 Execution**

### Time comparison between MD5 and SHA1:

```
In [10]: # Time comparison between MD5 and SHA1:

import hashlib
import time

def calculate_hash_md5(file_path):
    with open(file_path, 'rb') as f:
        md5_hash = hashlib.md5()
        while chunk := f.read(4096):
            md5_hash.update(chunk)
        return md5_hash.hexdigest()

def calculate_hash_sha1(file_path):
    with open(file_path, 'rb') as f:
        sha1_hash = hashlib.sha1()
        while chunk := f.read(4096):
            sha1_hash.update(chunk)
        return sha1_hash.hexdigest()

def measure_time(file_path, algorithm):
    start_time = time.time()
    if algorithm == 'md5':
        calculate_hash_md5(file_path)
    elif algorithm == 'sha1':
        calculate_hash_sha1(file_path)
    end_time = time.time()
    return end_time - start_time

file_sizes = {'1KB': '1kb.txt', '5KB': '5kb.txt', '10KB': '10kb.txt'}

for size, file_name in file_sizes.items():
    print(f"Calculating hash for {size} file...")
    md5_time = measure_time(file_name, 'md5')
    sha1_time = measure_time(file_name, 'sha1')
    print(f"MD5 Hash time: {md5_time:.6f} seconds")
    print(f"SHA1 Hash time: {sha1_time:.6f} seconds")
    print()
```

```
Calculating hash for 1KB file...
MD5 Hash time: 0.000580 seconds
SHA1 Hash time: 0.000017 seconds
```

```
Calculating hash for 5KB file...
MD5 Hash time: 0.000104 seconds
SHA1 Hash time: 0.000009 seconds
```

```
Calculating hash for 10KB file...
MD5 Hash time: 0.000097 seconds
SHA1 Hash time: 0.000011 seconds
```

## Practical and Real Time Applications

- In Windows OS, PowerShell function "Get-FileHash"
- Android ROMs
- File servers - file servers often provide a pre-computed MD5 (known as md5sum) checksum for the files, so that a user can compare the checksum of the downloaded file to it.
- Most unix-based operating systems include MD5 sum utilities in their distribution packages

### Conclusion:

The program was tested for different sets of inputs.  
Program is working SATISFACTORY NOT SATISFACTORY ( Tick appropriate outcome)

Lab Manual prepared by : Prof. Monali Shetty

### Post Lab Assignment:

1. Why is SHA-1 more secure than MD5?
2. Which of the following is not included in hash function?
  - a. Authentication.
  - b. Message integrity.
  - c. Fingerprinting.
  - d. Inefficiency.
3. Which of the following is used to detect transmission errors, and not to detect intentional tampering with data?
  - a. CRC.
  - b. Similar checksum.
  - c. WEP.
  - d. Hash function.
4. Which of the following is not provide by hash function?
  - a. Efficiency.
  - b. Two-way.
  - c. Compression.
  - d. Weak collision resistance.

## CSS Exp 3

## POSTLAB

Q.1)

SHA 1 is more secure than MD5 in the following ways

a) Longer digest length :- SHA1 employs a stronger a longer digest as compared to MD5 making it less prone to collision attacks due to increased number of possible hash values

b) Stronger algorithm design :- SHA-1 employs a stronger algorithmic design with more complex operations including bitwise operations and logical functions compared to MD5 making it less susceptible to cryptographic vulnerabilities.

c) Resistance to preimage attack : SHA-1 is more resistant to preimage attacks compared to MD5 meaning, it's harder to reverse-engineer the original input from its hash value, enhancing its security for applications requiring data.

Integrity verification

d) Cryptographic strength :- SHA1 provides stronger cryptographic strength than MD5 due to its larger digest size and algorithmic complexity ~~due~~ making it a more robust choice for security sensitive applications.

e) Industry Recommendations :- SHA1 is recommended over MD5 by cryptographic experts and industry standards bodies like NIST due to its improved.

security properties making it a more trusted, and widely adopted hashing algorithm in practice.

### 2) d) Inefficiency

Hash functions are primarily used for authentication, message integrity and fingerprinting. While ineff. efficiency, can be consideration in choosing a hashing functions, its not a fundamental property of hash functions themselves.

### 3) a) CRC

Cycle Redundancy check is primarily used to detect transmission errors such as those that can occur during data transmission, over a network or storage medium while CRC can detect accidental errors it is not designed. Intentionally tampering with data.

### 4) b) Two way

Hash functions are designed to be one way functions meaning they are easy to compute in one direction but computationally infeasible to reverse.
